ROBE SURVEYS

At Robe Surveys we can offer the complete spatial positioning solution for your project. It all starts with a ground model survey of the existing surface.

Once the existing surface has been captured utilizing a combination of the latest surveying technologies you can then begin to design your project knowing you have all the information at your finger tips.

From there we can setout all your initial bulk earthworks and load all your machines with the design models to get things moving in the ground. Any earthworks movements can be calculated using state of the art office software and reports generated for volume quantities.

Once earthworks have conformed to the design structures can be setout for construction.
